Introduction

The Dynisco model PT338 pressure transducers are designed to measure up to 10,000 psi. These models incorporate a 350-ohm, bonded foil strain gage Wheatstone Bridge. This proven technology provides an output of 0 Ð 3.0 mV/V (nominal), proportional to hydraulic pressure (within the specified error band). These transducers convert changes in applied pressure into corresponding changes in output voltage. This output signal can be fed into a wide range of readout instruments with millivolt sensitivity.

Pressure Fitting

The pressure fitting on the PT338 transducer is a 7/16-20 UNF-3A external port. The fitting is fabricated from high-strength stainless steel.

Wiring (cont.)

The full-scale output of the PT338 pressure transducer is 3 mV/V. The power supply should be well regulated with recommended excitation of 10 Vdc, 15 Vdc maximum to the transducer. Six conductor-shielded cable, such as Dynisco P/N 800024, should be used for transducer connections.

Internal Shunt Calibration

Each transducer includes an internal shunt calibration ("R-Cal") function that is used to simulate a signal of 80% full scale, this is achieved by crossing pins E and F. This eliminates the need for cumbersome calibrated pressure source when scaling associated instrumentation.

Transducer Repair

Questions concerning warranty, repair cost, delivery, and requests for a RA# should be directed to the Dynisco Repair Department, 508-541-9400 or email: repair@dynisco.com. Please call for a return authorization number (RA#) before returning any product. Damaged transducers should be returned to:

Dynisco, LLC
Repair Department RA#
